

Create Git ignore (.gitignore) ✓

Specify which folders to ignore  
by doing the following:

folder\_name/

It looks like I might need to use  
the ".git/info/exclude" file with the  
text editor.

That does a ".gitignore" function without  
sharing the ".gitignore" with everyone  
else. It appears that it is local to  
my repository alone.

Looks like it's also called  
"\$GIT\_DIR/info/exclude"

Found a blog online that says you need to type that address into your explorer, like so:

...\git\info\exclude

And then windows will prompt you with which text editor you want to utilize

Update: This worked!!

I ended up needing to actually use Git Bash to untrack the folder entirely, since it had already been added to the list of changes.

However, this file does work as intended.
